Proskoura V.V. Crime portrait of a territory as a compulsory condition of forecasting and resistance of crime, also assessment of efficiency of law enforcement activity

In this article the theme of necessity of creation a universal model of forecasting and criminality diagnosing at different territorial levels will be covered. The similar model will allow to estimate overall performance of law enforcement agencies, without dependence on the country. Criminological portrait of territory will allow to decide set of administrative problems, such as an estimation of overall performance of state structures higher and control divisions in sphere of counteraction of criminality that as consequence, defines and will simplify interaction in this direction. Besides it, similar modeling will allow to calculate a criminality index, its structure, dynamics with the maximum accuracy, to predict it, to warn. Possibility to fix and social indicators, such as standard of living and the population income, employment and a proportional parity of shadow and legal sector of economy will be presented. All these data will probably specify under each territorial unit taking into account all nuances.

Key words: criminality, criminality diagnostics, criminality forecasting, the criminality prevention, criminological a territory portrait, law enforcement agencies, modeling.
