Kovaleva T.N. Transport problems of the modern city in the context of urban space modernization

It is considered relevant for the modern world problem – the impact of road transport on the character and quality of life in the modern city. Referring to the concepts of philosophical understanding of urban life in the modern world, the author points out the view of critics on motorization of the modern city, emphasizing the dehumanizing potential of wide distribution of vehicles in modern cities. Among the major challenges of modern cities are deterministic motorization that allocated pollution, the destruction of the cultural and natural landscape of the city, reduction of the speed of citizens movement as a result of traffic congestion. To solve the problems of vehicles it is necessary to formulate a new strategy for urban development, guided by the principle of "the city for man."

Key words: city, auto industry, transport, urban space, ecology.
