Fedotova M.G. Constructive role of information signification in transitive society

Based on the principles of synergetics and dynamic information theory it is grounded the thesis that the transitive society is a factor in the valuation of information designing a new posttransitional social system. It is discovered the limited approach to information as a quantitative phenomenon, proved the role of semantics in the selection of variants of social development. Reconstruction of ideas about the semantics of the information makes possible to identify a number of dynamic stages of the design process posttransitional society on the basis of signification (making sense) of information: a dynamic chaos (underflow former social landmarks); emergence of clean clusters (the emergence of new meanings in some individuals); mosaic stage (expansion zone signification information specific semantics), stage flooring (intensification of the struggle for the vision of a sense of social transformation) of pure cluster formation (single meaning of social change).

Key words: valuation, information, semantics, dynamic information theory.
