Axiologic aspects of interaction between the humanities and natural sciences

It is discussed the methodological approaches of modern post-nonclassical science. Modern science has distinct value characteristics. Axiological component is presented in scientific knowledge from the very beginning of science. The author emphasizes that modern science, in a sense, infringes on the space of semantic dominants. The humanitarian cognition is not just the study of a certain phenomenon, but at the same time its constituting, involving sense and values. Within the humanitarian approach science comes to the necessity of rethinking its own goals. In current stage of development, postnonclassical science is characterized by active methodological pluralism. Axiological methodological tradition in the field of science scientific knowledge focuses on the simultaneous understanding of individual and description of the general.

Key words: science, value, integration, axiology, methodology.
