On the determinacy of means of cohesion by features of scientific style and discourse

The article deals with the features of the organization of scientific discourse in terms of linguistic means of expression. An important role of cohesion for the scientific style and discourse is noted, since the connectivity parameter is one of the typological features of a scientific text. The focus is on the means of cohesion, acting in the role of so-called discursive markers, which, along with providing lexical and grammatical cohesion, perform various pragmatic functions. The study of cohesion means is carried out using an invariant-variant approach. The results of the analysis confirm that the sub-discursive variability of the cohesion means is determined by the prevalence of different strategies for providing information in scientific sub-discourses.

Key words: cohesion, means of cohesion, scientific discourse, discursive markers, sub-discursive variability, invariant-variant approach.
