Significance of value-sense bases of scientific activity in modern stage of science development

At the present stage of the development of science, considerable attention is paid to the “knowing subject”, the need for reflection of the cognitive and value-semantic determinants of scientific knowledge. It is shown that scientific activity is inextricably linked with certain ethical standards and principles, as well as morally valuable habits and qualities, such as determination, responsibility, which does not allow us to call it “morally neutral”. The analysis of the categories of "value", "meaning" and "evaluation" is carried out taking into account the specifics of their understanding in the framework of scientific and cognitive activity.

Key words: science, value relation, value, meaning, ethos, axiologization, scientific activity.
