Phenomenon of descientization in Modern Russia

It is considered the phenomenon of descientization, which discredits science and destructively affects the development of society. Despite the obvious signs of sabotage in the activities of pseudoscientists, the state has not developed a policy to counter them. With the rapid development of information technology, the global information space is filled with irrelevant, unreliable and pseudoscientific information. It is analyzed pseudoscience as a socially dangerous phenomenon and evaluated the counteraction activity of rational science.

Key words: descientization, scientific lie, scientific knowledge, information security.
