Communicative-linguistic ontology and digital being

It is considered the question of the correlation between communicative-linguistic ontology and digital being. Communicative-linguistic ontology is characterized by the subjectivity of the surrounding reality by the individual's consciousness; the real world objectivity; intersubjectivity as a single onto-epistemological space of discourse. A linguistic personality acts as an actor in digital ontology. Language, intersubjective communication, and the language community contribute to its formation as a phenomenon of modern life. Being in society, a linguistic personality assimilates socially constructed concepts, using the currently relevant conceptsphere as a basic onto-epistemological unit of digital ontology. The language community integrates the social and linguistic determinants of the conceptsphere and expresses them in discourse. A distinctive feature of digital being is *permanent communication* between subjects.

Key words: linguistic ontology, language, intersubjective communication, language community, conceptsphere, digital being.
