The problem of artificial intelligence: What does ChatGPT think about itself?

The article discusses issues related to the concept of “artificial intelligence” and its characteristic features, as well as the concept of “neural network” and the most popular chatbot LaMDA, the ChatGPT neural network. The main features of the LaMDA chatbot and the ChatGPT neural network are described. LaMDA is a neural network capable of supplementing proposed phrases, answering questions and solving creative tasks, which is achieved by analyzing a huge amount of data and finding connections in texts. ChatGPT can conduct a conscious dialogue with the interlocutor: answer questions, give advice and explain complex concepts. The article raises the topic of ChatGPT neural network comprehension of possibilities in terms of comprehending its thinking abilities, sensory perception of the world and the ability to benefit and harm. Of all the signs of conscious artificial intelligence has the following: the ability to form a concept, judgment, inference; reflection and generalization of experience accumulated and constantly replenished by a person.

Key words: artificial intelligence, neural network, machine learning, deep learning, the ability to think.
