Self-determination of a young person through virtual space

This article is devoted to the formation of the personality of a young person under the influence of virtual reality. The characteristics of the value orientations of modern youth are given in the context of the transition of society to virtual space. The influence of Internet networks on self-determination and self-realization of a young person is considered. It is shown that the formation and creation of an information society in the modern world is based on the Internet communication network, which is the basis of existence among the younger generation. The creation of an information society contributes to the development of social networks and educational resources, through which young people can obtain the necessary knowledge and skills. It is argued that the commercialization of video hosting contributes to the formation of consumer and destructive orientations of young people.

Key words: self-determination, socialization, virtual socialization, information space, youth, social networks.
