Lexical aspects of online glossary development on artificial intelligence

The paper sets out a lexical minimum for the development of an online glossary on Artificial Intelligence, and substantiates the importance of creating such a glossary for a deeper understanding of concepts in this field by both specialists and the general public. The main lexicographic criteria are considered, taking into account which lexical material related to the terminology of AI is selected and systematized, and auxiliary elements of the dictionary entry (audio pronunciation and examples of the use of the term in the context) are described, facilitating the development of terms. These dictionary definitions are a new experience of bilingual ordering and characterization of the concepts of AI available in modern science. It has been established that the field of AI has many thematic subsections that are actively expanding as digital technologies improve.

Key words: artificial intelligence; lexicology; lexicography; micro-composition; online glossary, AI terminology.
