Philosophical reflection on the relationship between artificial and natural intelligence in modern culture

The article implements a philosophical reflection on the problem of the correlation of natural and artificial intelligence in the context of philosophical anthropology. It is concluded that, despite all the achievements of scientific and technological thought and technological progress, the source of all innovations is still man. The author also points out a new aspect of the existence of technology next to humans, namely, attention is paid to the analysis of the cause-and-effect relationships between natural and artificial intelligence. The author argues that today there is an increase in the importance of technology in human life, the compensatory effect of technology at the first stage of its spread is highlighted, and the emerging competitive trend in the existence of technology and the formation of elements of mythological consciousness is pointed out in connection with the growing popularity of artificial intelligence in modern human life.

Key words: philosophical anthropology, artificial intelligence, natural intelligence, anthropomorphism, mythologization of artificial intelligence in human consciousness.
