Climate cone in providing clean energy from the position of cognitive modeling

The authors raise the issue of the need to create a climate cone - a specialized diplomatic body that would deal with solving problems related to climate change, analyzing identified risks to security and the economy, as well as issues of global coordination of these activities. In turn, this service can also study the influence of public opinion on issues of changing the climate agenda. The study conducted cognitive modeling, the result of which is the construction of a cognitive model "Climate Cone". The authors analyze the assumption that the formation of public beliefs and political preferences is the main way aimed at forcibly reducing emissions by enterprises operating on fossil fuels.

Key words: environmentally friendly energy, climate disasters, climate diplomacy, public opinion, fossil fuels.
